

Control and Security

Remote access to your facilities

iLock is a keyless lock with an instant alarm system and remote access:

USER IDENTIFICATION
ALERTS WHEN OPENED

GPS TRACKING
REMOTE ACCESS

It is an innovative, IoT-based lock that can be opened remotely. Its advanced Bluetooth connectivity enables the identification and management of several users with different authorisations.

Thanks to its access control function, iLock is a unique access management tool, which keeps a full record of when it was opened, how long it remained open and by whom.

iLock offers never-before-used security capacities, geared towards remote areas with no electricity supply. It is equipped with a revolutionary hard or flexible shackle that detects any attempts to open or cut through it.

Useful for a wide variety of uses and applications, including the protection of static or mobile inventories, telecommunications centres, supply stations, accesses or goods in any place, providing peace of mind and maximum control.

Personal identification

It can assign a unique ID to each of its users and block non-authorized access.

You're the key

It can be unlocked remotely by authorized users, without requiring a key.

Flexible yet secure

The first smart lock offering a flexible shackle. The shackle detects any attempts to cut through it, reporting them instantly. It can be adapted to any length.

Mobitec IT is an innovative company specialised in the development of tracking and remote data management applications. We develop comprehensive information management and telemetric systems.

We provide key consultancy service in the logistics, tracking and quality management processes of your products. We offer a wide range of options in the fields of merchandise control, strict control of the cold chain and geolocalisation.
